

Division of Human Genetics

**Cincinnati Children's Hospital Medical Center**

**Cytogenetics Laboratory**

**Microarray : SNP(Omni1)**

**Current Methodology: For tests processed on October 15, 2012 or later**

**METHODOLOGY:** The microarray analysis was performed using the Infinium Assay with the Illumina HD HumanOmni1-quad BeadChip platform. This chip contains approximately 1,140,419 probes including both single nucleotide polymorphisms (SNP) and non-SNP alleles. The test is used to identify chromosomal imbalances throughout the human genome. These imbalances include deletions, duplications and aneuploidy. Microarray testing is not designed to detect balanced chromosomal changes, insertions or deletions that are in regions not well covered with probes. Also, it is not used to reliably detect low level mosaicism (<15% of cells with an abnormality). Small genetic alterations, such as point mutations and small deletions within a single gene, may not be detected with the DNA beadchip analysis. Polymorphisms (common genetic changes) and rare variants (less common imbalances) with unknown clinical significance may be detected with this technology. Imbalances that are detected in regions of known copy number variation may not be reported if they are considered to be a benign copy number change with no known clinical significance at the time this report is issued. Results are described using the ISCN (2009) guidelines. Linear positions of abnormalities are listed according to the Human Genome Build (GRCh37: Feb. 2009(hg19)). Information regarding genes located within chromosomal regions are obtained from Database of Genomic Variants (<http://projects.tcag.ca/variation/>) or from the NCBI RefSeq Project (<http://www.ncbi.nlm.nih.gov/RefSeq>) . Detailed methodologies are available on request.

This test has not been cleared or approved by the United States Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. This laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 ('CLIA') as qualified to perform high complexity clinical laboratory testing. The performance characteristics of this test have been developed and validated by the Cincinnati Children's Hospital Cytogenetics Laboratory.

Should you have any additional questions regarding this diagnosis or its implication, please do not hesitate to contact the Cincinnati Children's Hospital Cytogenetics Laboratory at 513-636-4474 and ask to speak with a geneticist or genetic counselor.
