Healthy Weight in Children and Teens

Obesity is the most common worldwide health problem in children and adults.

**ASSESSMENT**

At well-child visits for every patient age two and older, perform physical exam and family history. Assess healthy eating and active living behaviors. Provide “5-2-1-0” prevention counseling for daily behavior: five fruits or vegetables, two hours or less of screen time, one hour or more of physical activity and zero sugary drinks (including juice).

Accurately determine height and weight and calculate/plot body mass index (BMI):
- Obese (BMI ≥95%)
- Overweight (BMI 85–94%)
- Healthy weight (BMI 5–84%)

For children age three and older, take blood pressure.

**Lab Evaluation**

If obese, consider a lab evaluation that includes:
- Glucose and lipid profiles (fasting, if possible)
- AST and serum ALT
- Hemoglobin A1C

If overweight, obtain a lipid profile. Determine health risk factors based on behaviors, family history, review of systems and physical exam.
- If risk factors are present, consider lab evaluation as described above for obese patients
- If risk factors are absent, follow management guidelines as described below for healthy weight patients

**HPE (HISTORY AND PHYSICAL EXAM) RED FLAGS**

- ALT or AST >40 units/L
- Fasting LDL >130 mg/dl (normal is up to 100 mg/dl)
- Fasting triglycerides >130 mg/dl
- HgA1C >5.6%
- Elevated blood pressure
- Signs of disordered eating
- Concerns for possible abuse

**MANAGEMENT/TREATMENT**

If overweight or obese:
- Plan 15–20 minute follow-up focusing on behaviors that resonate with patient, family and PCP
- Consider partnering with dietician, social worker, athletic trainer or physical therapist for added support and counseling

Goal is two-fold: to achieve positive behavior change regardless of BMI change and to achieve weight maintenance or a decrease in BMI velocity. Monthly follow-up is appropriate. After 3–6 months, if the BMI/weight status has not improved, consider referral to the Cincinnati Children’s Center for Better Health and Nutrition (Healthworks!)

If healthy weight:
- Provide ongoing positive reinforcement for healthy behaviors
- Screen for genetic dyslipidemia by obtaining a non-fasting lipid profile between the ages of 9–11 and again between 18–21

If you would like additional copies of this tool, or would like more information, please contact the Physician Outreach and Engagement team at Cincinnati Children’s.
Healthy Weight in Children and Teens

Inclusion Criteria

- Patients age 2 and older

Patient Presents

Standard Workup

- Family History
- Physical History
- Assess healthy eating and active living behaviors

Provide 5-2-1-0 Prevention Counseling

- 5 Fruits or vegetables
- 2 Hours or less of screen time
- 1 Hour or more of physical activity
- 0 Sugary drinks every day

Determine Weight Classification

- Accurately determine weight and height, calculate and plot Body Mass Index (BMI) and determine BMI percentile.

Healthy Weight
(BMI 5–84%)

Risk Factors Absent

Routine Care

- Provide ongoing positive reinforcement for healthy behaviors.
- For patients in the healthy weight category, screen for genetic dyslipidemia by obtaining a non-fasting lipid profile for all children between the ages of 9–11 and again between 18–21.
- For patients in the overweight category, obtain a lipid profile.
- Maintain weight velocity:
  - Crossing 2 percentile lines is a risk for obesity
  - Reassess annually
  - Follow up at every well-child visit.

Overweight
(BMI 85–94%)

Determine Health Risk Factors*

- Lab Screening

- The 2007 Expert Committee Recommendations state that a fasting glucose and fasting lipid profile along with ALT and AST should be obtained.
- Additionally, guidelines from the ADA and Endocrine Society recommend using A1C, fasting glucose or oral glucose tolerance tests for diabetes or pre-diabetes. The ADA notes that there are presently limited data supporting A1C for diagnosing diabetes in children and adolescents; however, they are continuing to recommend A1C at this time.
- For patient convenience, some providers are obtaining non-fasting labs.
- Clinical judgment, local preferences and availability of testing should be used to help determine the timing of follow up of abnormal labs.
- Of note, some subspecialty clinics are screening for Vitamin D deficiency and insulin resistance by obtaining labs for Vitamin D and fasting insulin. The clinical utility and cost effectiveness of such testing is yet to be determined.
- Currently, there are no guidelines on when to start laboratory testing for patients with obesity. Based upon the patient's health risk, some experts may start screening patients at 2 years of age.

Obesity
(BMI >95%)

Risk Factors Present

Obesity-related Conditions

The following conditions are associated with obesity and should be considered for further work-up. Additional lab tests may be warranted if indicted by the patient’s clinical condition. In 2014, consensus statements from The Children’s Hospital Association described the management of a number of these conditions.

**Dermatologic:**
- Acanthosis nigricans
- Hirsutism
- Intertrigo

**Endocrine:**
- Polycystic ovarian syndrome (PCOS)
- Precocious puberty
- Prediabetes: Impaired fasting glucose and/or impaired glucose tolerance as demonstrated during a GTT
- Premature adrenarche
- Type 2 Diabetes

**Gastrointestinal:**
- Cholelithiasis
- Constipation
- GERD
- Nonalcoholic fatty liver disease or steatohepatitis

**Orthopedic:**
- Blount’s Disease
- Slipped capital femoral epiphysis (SCFE)

**Psychological/Behavioral Health:**
- Anxiety
- Binge eating disorder
- Depression
- Teasing/bullying

**Neurologic:**
- Pseudotumor cerebri

*Based on behaviors, family history, review of systems, and physical exam, in addition to weight classification.
