Cytokine induced airway inflammation

*IL-13 administration.* Three doses (10 μg/mouse) of IL-13 were administered intratracheally every other day for 4 days.

*IL-4 administration.* A long acting form of IL-4 produced by mixing recombinant mouse IL-4 (Peprotech) with a neutralizing mAb (BVD4-1D11) at a 2:1 molar ratio (IL-4C), and was administered every other day for 7 days.
