Adults 18 to 65 Years Old with an Eosinophilic Gastrointestinal Disorder Needed for a Research Study

Why are we doing this research?
Cincinnati Children’s is conducting a research study, sometimes known as a clinical trial or clinical study, to find the best way to define how well a person with an eosinophilic disorder is doing. We also want to see if the way questionnaires are answered can give us an idea of how well the person is doing.

Who can participate?
Adults, 18 to 65 years old, with an eosinophilic gastrointestinal disorder may be eligible for participation.

Eosinophilic gastrointestinal disorders include: eosinophilic esophagitis (EoE), eosinophilic gastritis (EG), or eosinophilic colitis (EC).

What will happen in the study?
If you qualify and agree to take part in the study, the following may happen during your scheduled visit with your regular doctor:

• You will be asked to read and sign a consent form.
• Information about your eosinophilic disorder will be entered into a database.
• You will be asked to complete questionnaires about you and your medicines, medical history, test results, quality of life and symptoms (this will take 30 to 45 minutes and can be completed at home or during the visit).

** When we say “regular doctor”, we mean your doctor who treats your eosinophilic disease.

Standard of Care Endoscopy
During the study you will continue to receive normal standard of care (SOC) treatment from your regular doctor. The research study doctors will not treat your eosinophilic disorder, as it will be the choice of your regular doctor.

Optional Research Procedures During SOC
The following is a list of some of the OPTIONAL research procedures that may happen during your SOC endoscopy:

• We would like to collect additional samples of blood, for DNA, during your SOC endoscopy.
• If you would like to provide DNA, but do not wish to donate blood, you may donate saliva instead. Saliva will only be collected if blood is not obtained.
• During your SOC endoscopy, we would like for your regular doctor to take additional samples of tissue for us to examine and store in a laboratory. We would also like to receive some of the tissue that your doctor examines after the biopsy.
• Before you come in for the SOC endoscopy, you will collect a stool sample and bring it to your appointment.
• If you have a follow-up SOC endoscopy while enrolled in the follow-up portion of this study, we would like your regular doctor to take additional samples of tissue for us to examine and store in a laboratory. We would also like to receive some of the tissue that your doctor examines after the biopsy.

Change in Standard of Care Treatment Visits
If you agree to participate in this part of the study, a member of the study team will contact you to schedule a visit whenever your regular doctor makes a change to your treatment (for example, a change to your diet or medication).

At this visit, you will be asked to complete questionnaires about you and your medical history, medicine(s), tests results, quality of life and symptoms. You can complete the study forms, which will take about 30 to 45 minutes, at home or during the visit.

Annual Follow-Up Visit
If you agree to participate in this part of the study, a member of the study team will call to schedule an annual follow-up visit.

At this visit, you will be asked to complete questionnaires about you and your medical history, medicine(s), tests results, quality of life and symptoms. You can complete the study forms, which will take about 30 to 45 minutes, at home or during the visit.

Genetic Tests (DNA)
The testing we do using the biopsy and stool samples is not a genetic test. However, the optional blood or saliva samples will be stored for future genetic testing. All DNA resulting from blood or saliva samples will be processed and stored at Cincinnati Children’s.

Genetic and DNA testing in this study is to find risk factor genes for eosinophilic disease. You will not receive results from this testing.

Participants interested in being part of this research will be given a consent form that thoroughly explains all of the details of the study. A member of the study staff will review the consent form with you and will be sure that all of your questions are answered.

What are the good things that can happen from this research?
You will not receive any direct medical benefits from participating in this research study. This study is not designed to treat any illness or to improve your health. However, we hope the results from this study may help you and other people with eosinophilic diseases in the future.

What are the bad things that can happen from this research?
A detailed list of possible side effects will be provided to those participants interested in knowing more about this study.
Will you/your child be paid to be in this research study?
Participants will not receive pay for their time, effort and travel for this study.

Who should I contact for more information?
