Best Evidence Statement (BESst)

Date: July 1, 2011

Evidence-Based Design of the Neonatal Intensive Care Unit (NICU)

Clinical Question

P (population/problem) Among infants in the NICU
I (intervention) does care in a single family room environment
C (comparison) versus care in an open bay environment
O (outcome) decrease safety incidents.

Target Population
Infants needing care in the Neonatal Intensive Care Unit

Definitions:

Open-bay environment is a unit that has 4 to 7 infants housed in one area, such as a pod.

Single family room (SFR) refers to a private room in which the patient is cared for and the family has the option to stay at the bedside continuously.

Recommendations (See Table of Recommendation Strength following references)

It is recommended that patients in a NICU be provided care in a single family room environment, to decrease the rate of safety incidents (Bartley and Streifel, 2010 [5a], Domancio, Davis, Coleman, and Davis, 2010 [3a], Domancio, Davis, Coleman, and Davis, 2010 [4a], Ortenstrand, et.al, 2011 [2a], & Walsh, W., Mcullough, K., and White, R., 2006 [4a].) [Grade for this body of evidence is moderate.]

Note: Both elements of staff and family satisfaction have also been proven to increase with the single family room environment.

Discussion/summary of evidence

Safety:

Within the evidence, five articles addressed safety in the following aspects: nosocomial infections, peripheral intravenous catheter infiltrates, and medication or other healthcare related errors (Bartley & Streifel, 2010 [5a], Domancio, Davis, Coleman, & Davis, 2010 [3a], Domancio, Davis, Coleman, & Davis, 2010 [4a], Ortenstrand, et.al, 2011 [2a], & Walsh, W., Mcullough, K., and White, R., 2006 [4a]).

Associations with decreased catheter associated blood stream infections (CABSI), increased breastfeeding success, and staff and family perceptions of safety, have been documented, with positive results, with the change to a single family room (SFR) environment. Domancio, Davis, Coleman, & Davis, (2010 [3a]) found a 2 day decrease in LOS, a significant decrease (57%) in apneic events, a significant (p=0.048) decrease in the amount of total parenteral nutrition days (which led to earlier breast milk introduction), and a comparative decrease in the nosocomial infection rate from 11% in the open bay environment to 6% in the SFR environment. A descriptive study by Walsh, Mcullough, and White, 2006 [4a] documented a significant decrease in nosocomial infections from 10.1 per 1000 patient days to 3.3 per 1000 patient days. Domancio, Davis, Coleman, & Davis, 2010 [4a]
and Bartley & Streifel, 2010 [5a] found that although the staff and families perceived an increase in safety related incidents these perceptions were not supported by the data.

**Note:**
In a randomized controlled trial in Sweden (Ortenstrand et al., 2011 [2a]), a 5 day reduction in length of stay (LOS) was found in preterm neonates admitted to the private room environment over those admitted to an open bay. Domancio (2010[3a]) also found a 2 day decrease in the LOS for those infants admitted into a SFR.

**Family and Staff Satisfaction Supporting Information:**

For staff and parent satisfaction, the grade for the body of evidence: moderate.

**Health Benefits, Side Effects, and Risks**
Some of the potential health benefits that may arise from a single family room NICU environment may include: decreased nosocomial infections, decreased length of stay, decreased need for oxygen therapy, decreased parenteral feeding times, increased incidence of breast milk/lactation, increased individualized developmental care, and increase in family participation in care. All of these factors may decrease harm and potential sequelae related to increased hospital stay.

Moving into a single family room unit may not create any side effects for the patient population. One of the potential risks could be the lack of experience of staff that has not used the single family room model of care, which in turn could lead to further safety incident. Another potential risk is while caring for another patient; the nurse is not able to continuously observe infants in another room.

Note: Full tables of evidence grading system available in separate document:
- Table of Evidence Levels of Individual Studies by Domain, Study Design, & Quality (abbreviated table below)
- Grading a Body of Evidence to Answer a Clinical Question
- Judging the Strength of a Recommendation (abbreviated table below)

### Table of Evidence Levels (see note above)

<table>
<thead>
<tr>
<th>Quality level</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1a† or 1b†</td>
<td>Systematic review, meta-analysis, or meta-synthesis of multiple studies</td>
</tr>
<tr>
<td>2a or 2b</td>
<td>Best study design for domain</td>
</tr>
<tr>
<td>3a or 3b</td>
<td>Fair study design for domain</td>
</tr>
<tr>
<td>4a or 4b</td>
<td>Weak study design for domain</td>
</tr>
<tr>
<td>5 or 5a or 5b</td>
<td>Other: General review, expert opinion, case report, consensus report, or guideline</td>
</tr>
</tbody>
</table>

†a = good quality study; b = lesser quality study

### Table of Recommendation Strength (see note above)

<table>
<thead>
<tr>
<th>Strength</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Strongly recommended”</td>
<td>There is consensus that benefits clearly outweigh risks and burdens (or visa-versa for negative recommendations).</td>
</tr>
<tr>
<td>“Recommended”</td>
<td>There is consensus that benefits are closely balanced with risks and burdens.</td>
</tr>
<tr>
<td>No recommendation made</td>
<td>There is lack of consensus to direct development of a recommendation.</td>
</tr>
</tbody>
</table>

### Dimensions:
In determining the strength of a recommendation, the development group makes a considered judgment in a consensus process that incorporates critically appraised evidence, clinical experience, and other dimensions as listed below.

1. Grade of the Body of Evidence (see note above)
2. Safety / Harm
3. Health benefit to patient (direct benefit)
4. Burden to patient of adherence to recommendation (cost, hassle, discomfort, pain, motivation, ability to adhere, time)
5. Cost-effectiveness to healthcare system (balance of cost / savings of resources, staff time, and supplies based on published studies or onsite analysis)
6. Directness (the extent to which the body of evidence directly answers the clinical question [population/problem, intervention, comparison, outcome])
7. Impact on morbidity/mortality or quality of life

---

**Supporting information**

**Introduction**

For years the design of the Neonatal Intensive Care Unit (NICU) has been referred to as a „baby barn“ in many instances. This refers to a room or many rooms, housing anywhere from 6 to 12 babies. In the early 1990s, the concept of the single family room NICU began to take shape. Many Pediatric Intensive Care Units and Cardiac Intensive Care Units have already started the transformation to new, private room models.

Slowly the NICU community has come to embrace this innovation and research examining the effects on outcomes. As of now, research regarding infant outcomes and safety is slowly starting to become available.

Copies of this Best Evidence Statement (BEST) are available online and may be distributed by any organization for the global purpose of improving child health outcomes. Website address: [http://www.cincinnatichildrens.org/svc/alpha/h/health-policy/ev-based/default.htm](http://www.cincinnatichildrens.org/svc/alpha/h/health-policy/ev-based/default.htm)

Examples of approved uses of the BEST include the following:
- copies may be provided to anyone involved in the organization’s process for developing and implementing evidence based care;
- hyperlinks to the CCHMC website may be placed on the organization’s website;
- the BEST may be adopted or adapted for use within the organization, provided that CCHMC receives appropriate attribution on all written or electronic documents; and
- copies may be provided to patients and the clinicians who manage their care.

Notification of CCHMC at HPCEInfo@cchmc.org for any BEST adopted, adapted, implemented or hyperlinked by the organization is appreciated.

For more information about CCHMC Best Evidence Statements and the development process contact: the Center for Professional Excellence/Research and Evidence-based Practice office at CPE-EBP-Group@cchmc.org. (513) 636-4780

**Note**

This Best Evidence Statement addresses only key points of care for the target population; it is not intended to be a comprehensive practice guideline. These recommendations result from review of literature and practices current at the time of their formulation. This Best Evidence Statement does not preclude using care modalities proven efficacious in studies published subsequent to the current revision of this document. This document is not intended to impose standards of care preventing selective variances from the recommendations to meet the specific and unique requirements of individual patients. Adherence to this Statement is voluntary. The clinician in light of the individual circumstances presented by the patient must make the ultimate judgment regarding the priority of any specific procedure.

Reviewed against quality criteria by 2 independent reviewers.
